Received 9 April 2014; accepted 30 April 2014

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{Sc}-\text{Cl}) = 0.001 \text{ \AA}$; R factor = 0.023; wR factor = 0.050; data-to-parameter ratio = 68.6.

Crystals of tricaesium scandium(III) hexachloride were obtained as a side product from the reaction of U, SnCl₂, Sc, and S in a CsCl flux at 1073 K. Cs₃ScCl₆ crystallizes in the Rb₃YCl₆ structure type. The asymmetric unit comprises three Cs sites, two Sc sites, and six Cl sites, all of which have site symmetry 1, except for the two Sc sites that have site symmetries of 2 and $\bar{1}$, respectively. The structure is composed of isolated [ScCl₆]³⁻ octahedra that are surrounded by Cs⁺ cations. Two Cs⁺ cations have interactions with eight Cl⁻ anions, while the third has interactions with ten Cl⁻ anions.

Related literature

Cs₃ScCl₆ crystallizes in the Rb₃YCl₆ structure type (space group $C2/c$; Mattfeld & Meyer, 1992). Previously, a number of ternary scandium halides of the composition $A_3\text{Sc}X_6$ were characterized by single-crystal X-ray diffraction or Rietveld refinements from powder data. These include Na₃ScF₆ (Dahlke & Babel, 1994), Na₃ScBr₆ (Bohnsack & Meyer, 1996), Li₃ScCl₆ (Bohnsack *et al.*, 1997), Li₃ScF₆ (Tyagi *et al.*, 2005), K₃ScCl₆ (Cerny *et al.*, 2010a), and Na₃ScCl₆ (Cerny *et al.*, 2010b). Except for Li₃ScCl₆, these compounds crystallize in one of two structure types: Na₃CrCl₆ ($P\bar{3}1c$; Friedrich *et al.*, 1987) or Na₃AlF₆ ($P2_1/n$; Náray-Szabó & Sasvári, 1938). For other caesium scandium chloride compounds, see: Poeppelmeier *et al.* (1980). For standardization of structure data, see: Gelato & Parthé (1987).

Cs₃ScCl₆

Matthew D. Ward and James A. Ibers

1. Comment

Ternary scandium halides of the composition A_3ScX_6 are known for $A = Li, Na, K$ and $X = F, Cl, Br$. These compounds crystallize in either the Na_3CrCl_6 ($P\bar{3}1c$) (Friedrich *et al.*, 1987) or the Na_3AlF_6 ($P2_1/n$) (Náray-Szabó & Sasvári, 1938) structure types, except for Li_3ScCl_6 which crystallizes in space group $C2/m$ (Bohnsack *et al.*, 1997). Single-crystal refinements have been carried out for Na_3ScF_6 (Dahlke & Babel, 1994), Na_3ScBr_6 (Bohnsack & Meyer, 1996), Li_3ScCl_6 (Bohnsack *et al.*, 1997), and Li_3ScF_6 (Tyagi *et al.*, 2005). The structures of K_3ScCl_6 (Cerny *et al.*, 2010a) and Na_3ScCl_6 (Cerny *et al.*, 2010b) were determined by Rietveld refinement of X-ray powder data. Cs_3ScCl_6 is the first Cs-containing compound of the A_3ScX_6 family. It crystallizes in the monoclinic space group $C2/c$ in the Rb_3YCl_6 structure type (Mattfeld & Meyer, 1992).

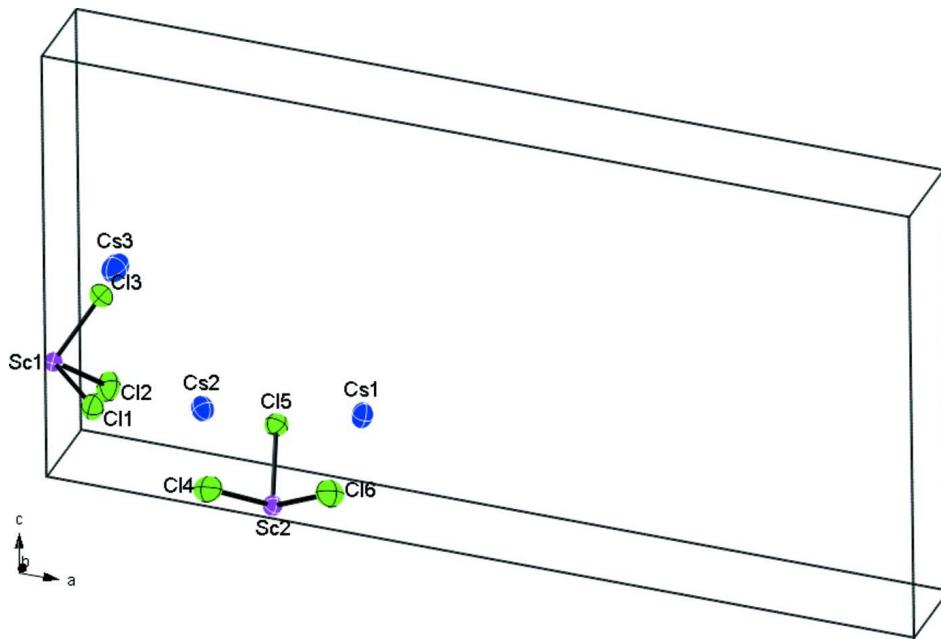

The structure of Cs_3ScCl_6 is composed of isolated $[ScCl_6]^{3-}$ octahedra that are surrounded by Cs^+ cations. The asymmetric unit, comprising three Cs, two Sc, and six Cl sites, is shown in Fig. 1, and a packing diagram is shown in Fig. 2. The composition achieves charge balance by assigning formal oxidation states of +1, +3, and -1 to Cs, Sc, and Cl, respectively. The Sc—Cl distances range from 2.4718 (5) Å to 2.5072 (6) Å at 100 K. These distances compare favorably with those of 2.601 Å at 298 K in $Cs_3Sc_2Cl_9$ (Poeppelmeier *et al.*, 1980). Another caesium scandium chloride compound is $CsScCl_3$ (Poeppelmeier *et al.*, 1980), which reportedly contains Sc(II).

2. Experimental

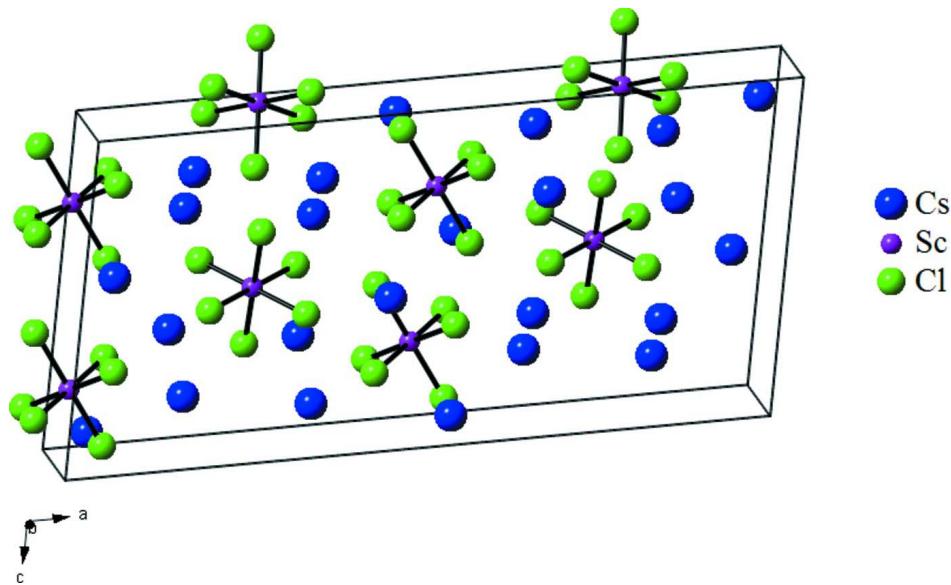

A reaction mixture containing U (0.126 mmol), $SnCl_2$ (0.126 mmol), Sc (1.290 mmol), S (0.378 mmol), and $CsCl$ (0.594 mmol) was loaded into a carbon-coated fused-silica tube under an inert Ar atmosphere. The tube was then evacuated to 10^{-4} Torr, flame sealed, and placed in a computer-controlled furnace. The tube was heated to 1073 K in 12 h, held there for 96 h, cooled to 773 K at a rate of 2 K/h, and then cooled to 298 K over a further 48 h. The reaction yielded black rectangular prisms of ScU_8S_{17} , purple blocks of Cs_3ScCl_6 , and excess $CsCl$ flux. Crystals of Cs_3ScCl_6 were also found as side products in other reactions that contained Sc and a $CsCl$ flux. Crystals of Cs_3ScCl_6 are soluble in water.

3. Refinement

Atomic positions were standardized with the program *STRUCTURE TIDY* (Gelato & Parthé, 1987). The highest peak of 1.0 (2) e⁻/Å³ is 2.18 Å from atom Cs2 and the deepest hole of -1.3 (2) e⁻/Å³ is 0.92 Å from atom Cs3.

**Figure 1**

The asymmetric unit of Cs_3ScCl_6 . Displacement ellipsoids at the 99% probability level are shown. Caesium atoms are blue, scandium atoms are purple, and chlorine atoms are green.

 $\Delta\rho_{\min} = -1.26 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
